

Where are we with our project:

For our JobFairs project, so far we have implemented inserting people into the peoples table, and venues into the venues table. We are working on issues with the application crashing after a venue is inserted. We have many forms designed without any implementation yet, but we are also working on getting a combobox populated to select a venue.

Thoughts and details on creating interviews:

For creating interviews, were going to allow the companies to specify what times they are able to interview and how many interviewers they have available. Using this information we are going to allow the candidates to choose from the times specified by the companies. When a candidate is signing up for an interview they must first select the company they would like to interview with and then select an available time.

Things that will need to be modified:

- Need to make companies table
- Company interviewers table

Collection of tasks:

- Finalize and test table classes (people, venue, etc.)
- Implement the ability to generate interviews
- Forms that go along with generating interview

Changes to current app:

- Deactivated feature where application objects would read their ID value back after being inserted into the table
- Added the user form that allows users to log in
- Debugging/ cleanup to make things work
